

System of System Integration Technology and Experimentation (SoSITE)

Jimmy “Reverend” Jones, Lt Col, USAF
Program Manager, DARPA/STO

Technology and experimentation to enable rapid and custom integration of any distributed architecture

Prepared for 2019 NDIA-SE Conference
Presented by: Chris “Lude” Kibble (SoSITE SETA)

23 Oct 2019 (v2)

Adding interoperability between aircraft takes years

- Aircraft are upgraded independently creating unique messages
- Machine-to-machine interfaces in an aircraft are highly coupled
- Even coupling between versions of the same spec (e.g., Link-16) is problematic

This interoperability problem occurs within the aircraft as well

- Components are tightly coupled together using a local message standard that doesn't match the documentation
- Adding new technology (e.g., sensor) requires upgrades to multiple components, increasing expense and time

Each aircraft is collection of independent subsystems designed at different eras requiring interoperability

Interoperability is programmed into each system
System upgrades compete in 2-3 year block cycles

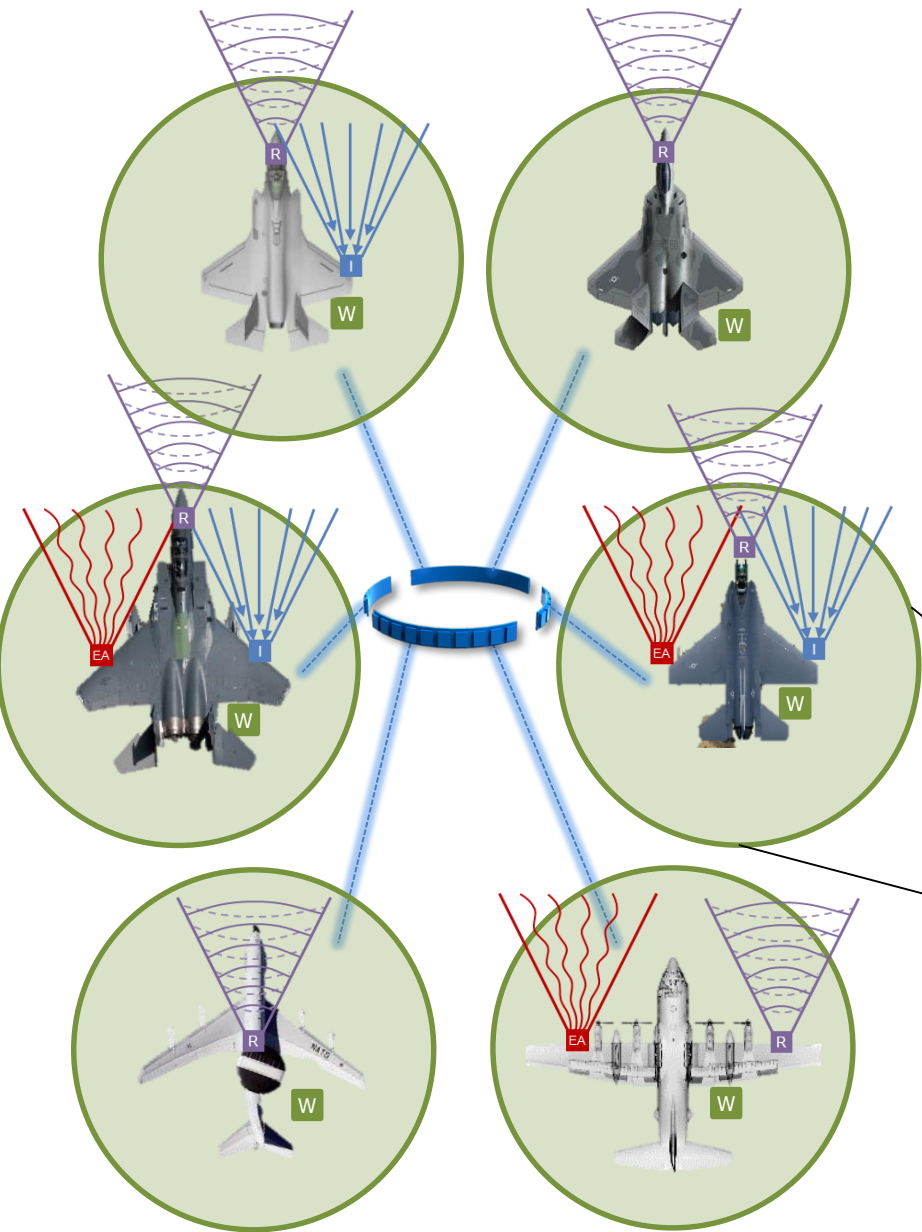

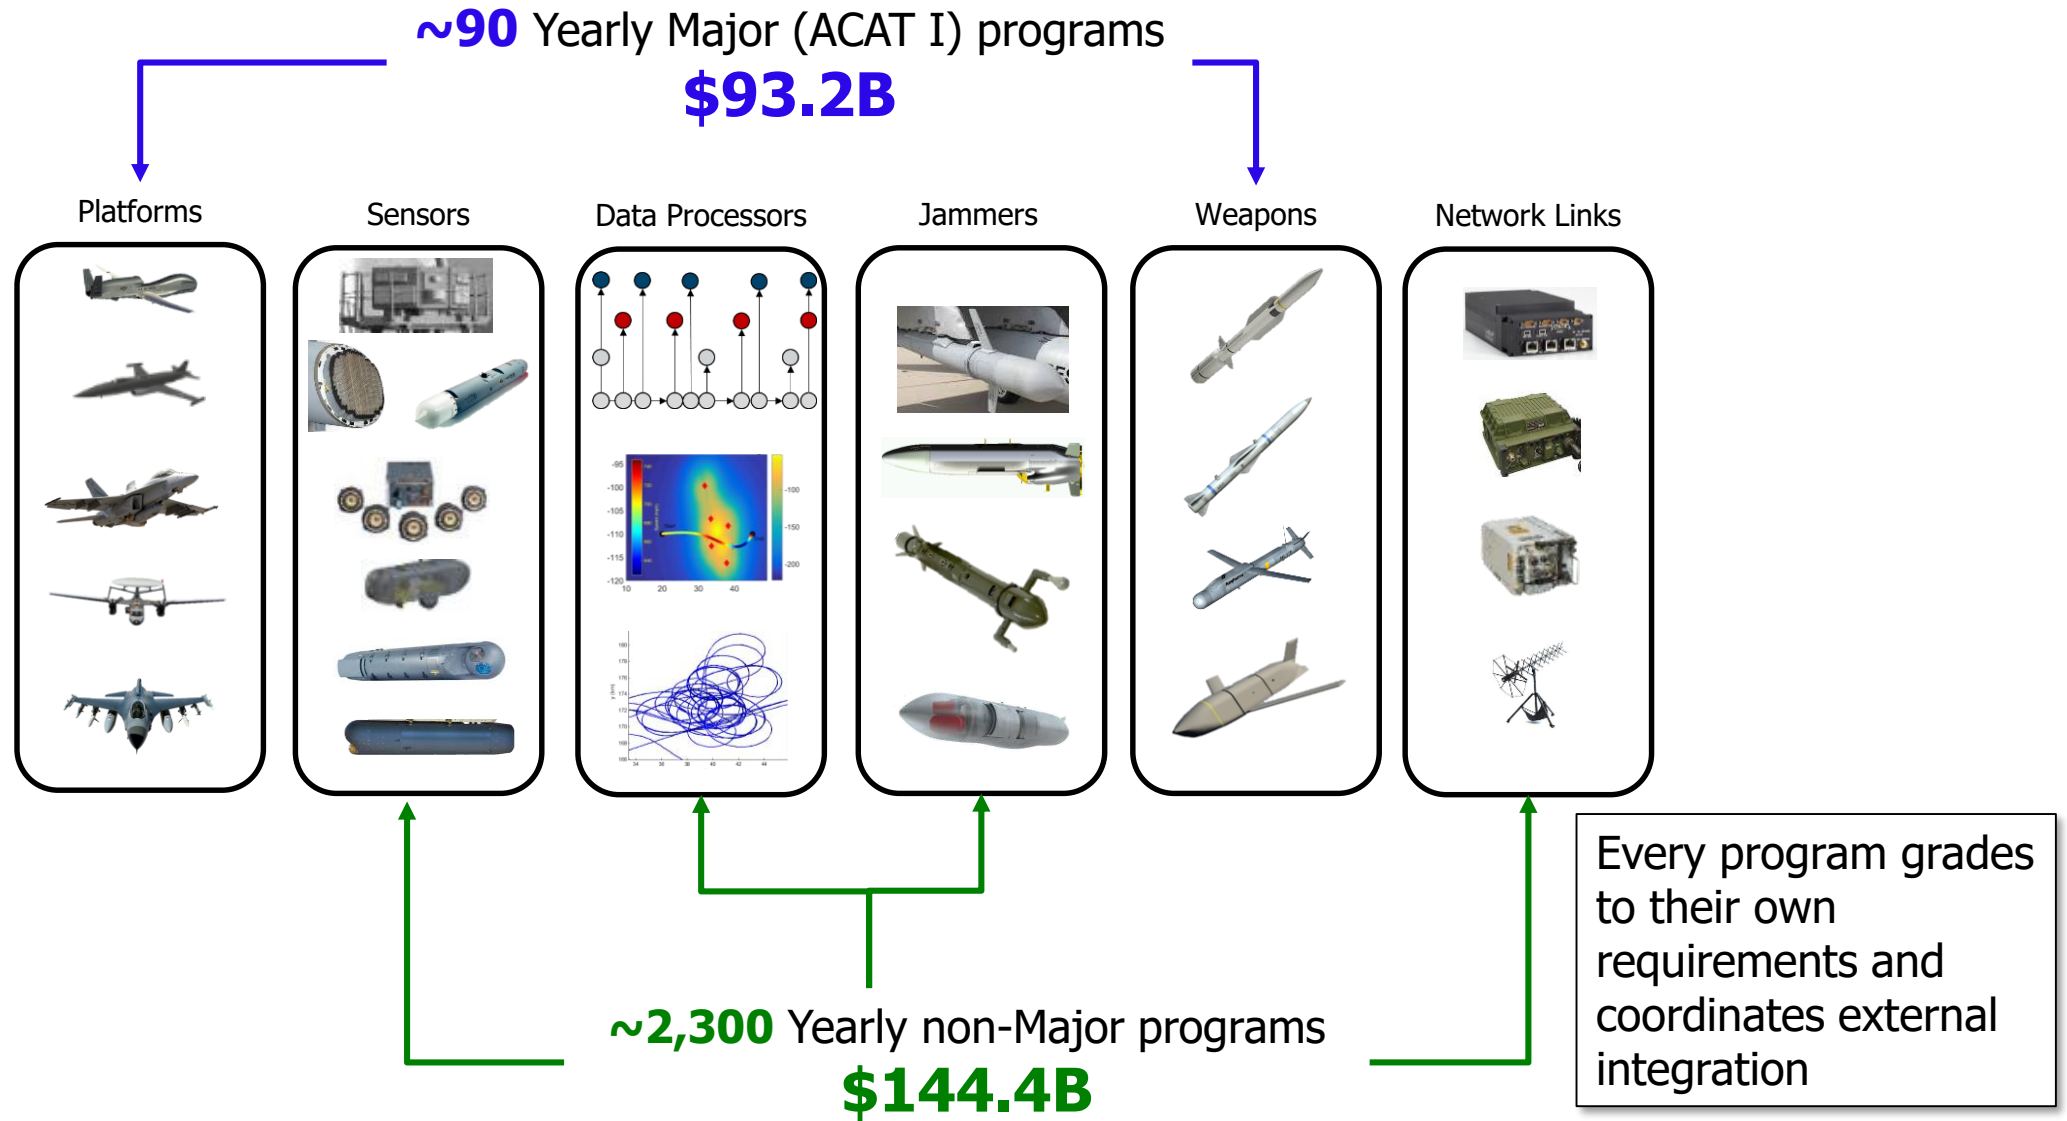

Global standards have similar issues

- No interoperability between generations of the standard
- Uncertain interoperability between implementations

Legend

- Radar
- Imagery
- Electronic Attack
- Warning System

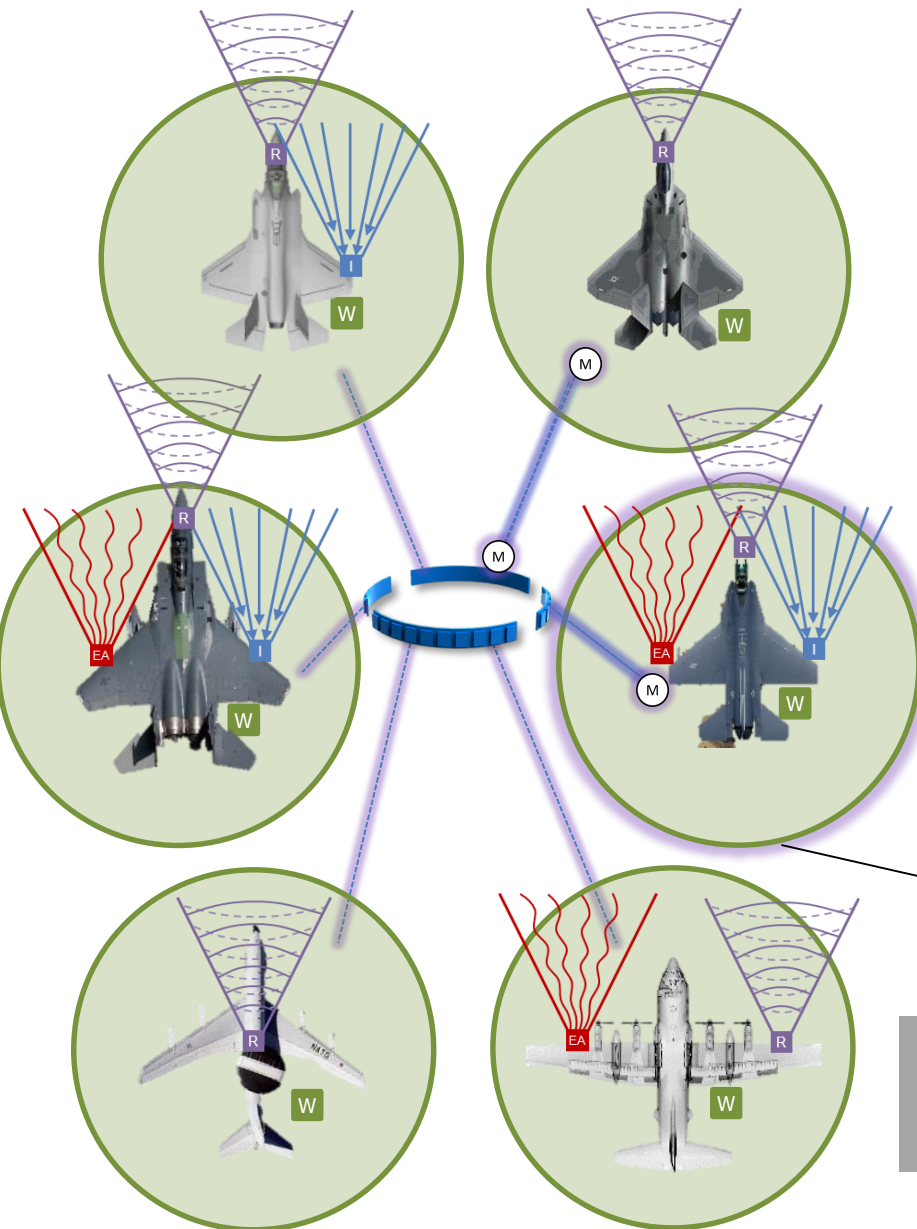

STITCHES efficiently generates message translators

- System software is modified once for STITCHES compatibility
- Generated code is uploaded like mission data files (MDFs)
- Allows for fast and easy reconfiguration of mission capabilities

Auto-generate efficient glue code to

- Interoperate between new subsystems and existing components; old and new generations of the "same" open specification
- Transform platform data to comm's message formats or encode any message inside fixed format standards like Link-16

A mission computer's (MC) software is modified to allow STITCHES MDFs to translate and control data flow

Any data on buses connected to STITCHES MDFs may be translated and rerouted inside or outside an aircraft

M Message

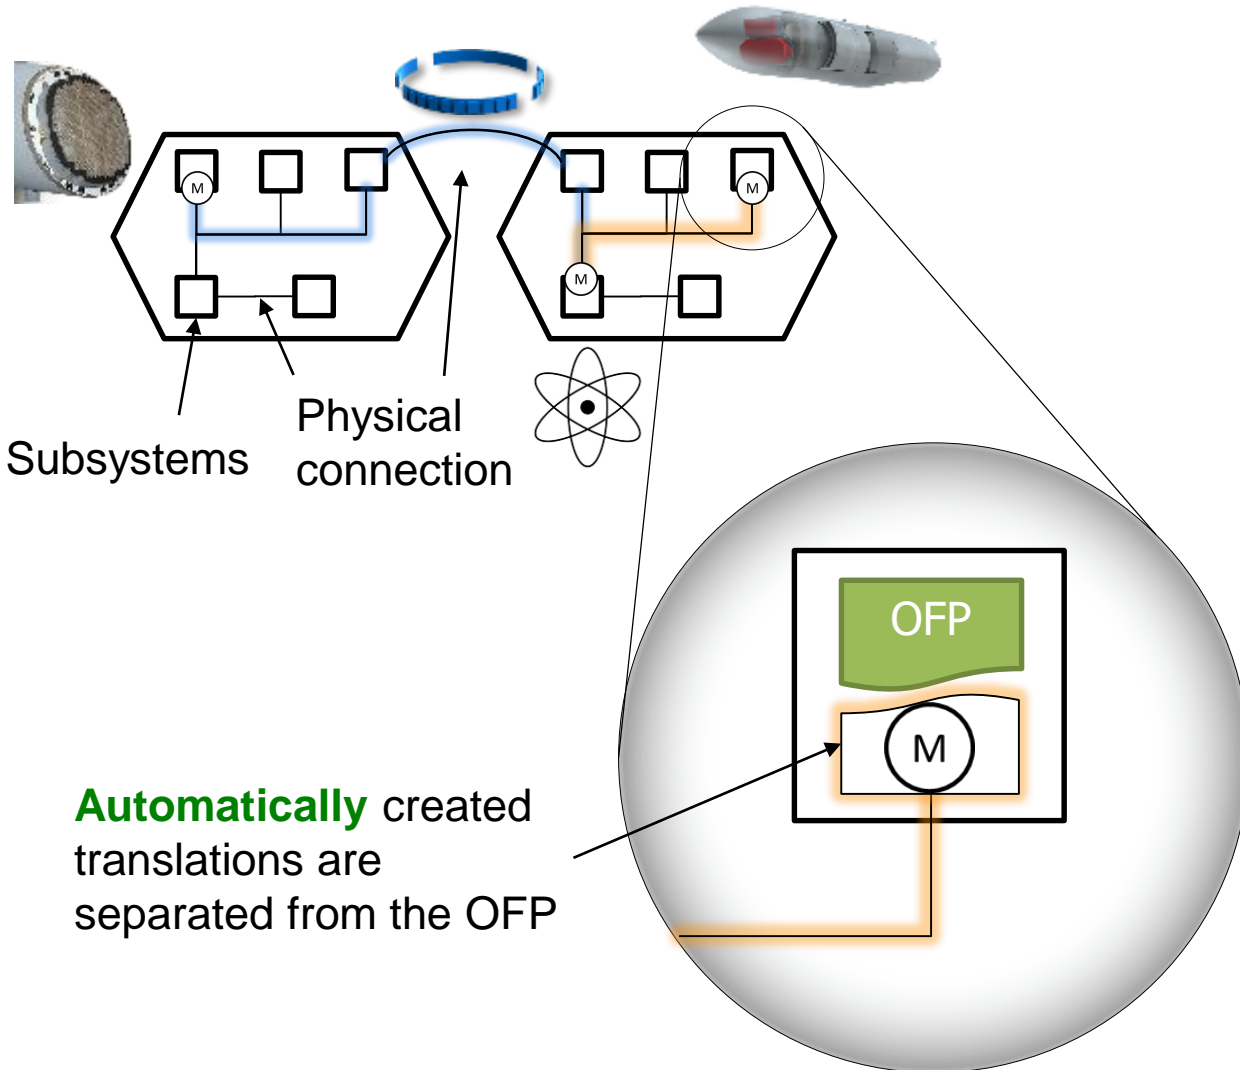

STITCHES MDFs **efficiently translate data** and **control data flow** in order to create interoperability between and within connected platforms

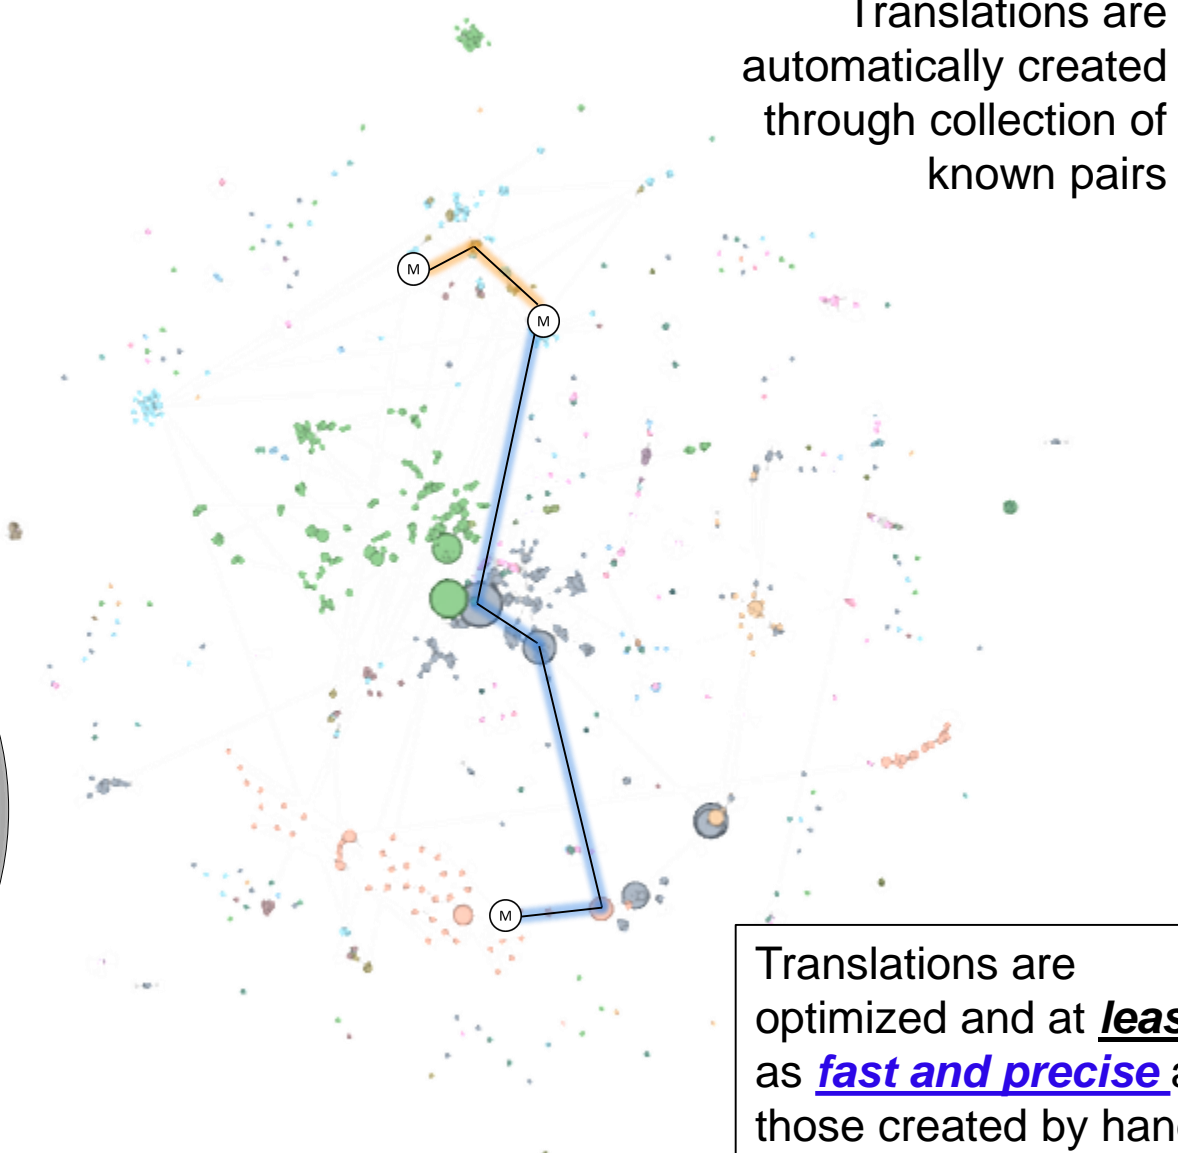

SoSITE integrates via a new toolchain called STITCHES

A System of System is created by a user

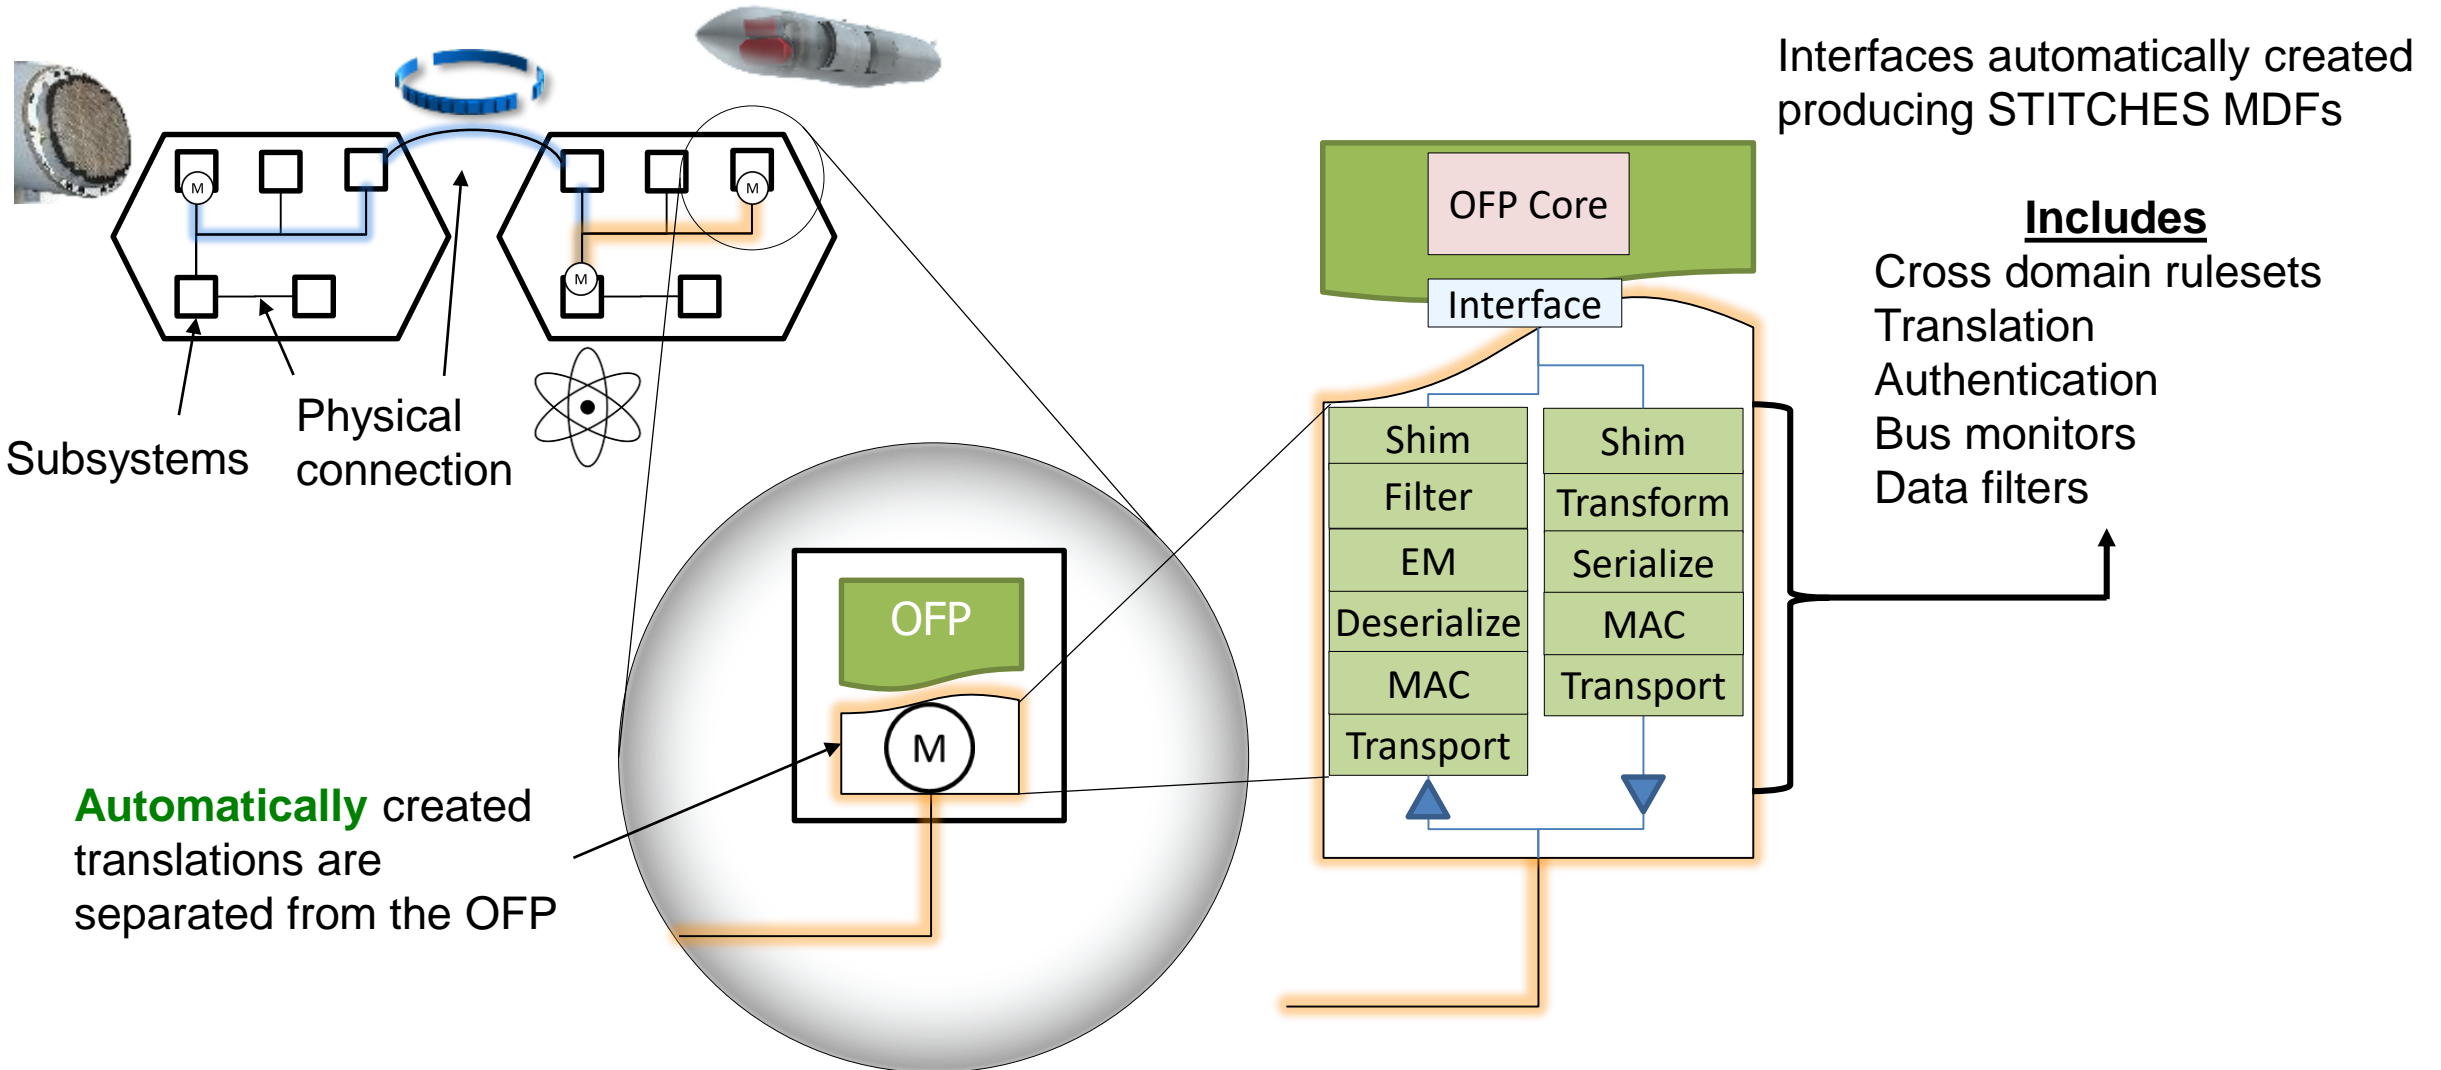

Translations are automatically created through collection of known pairs

Translations are optimized and at **least** as **fast and precise** as those created by hand

A System of System is created by a user
